More than 5,000 ha were sown with yams at Korostyshivzeminvest

"Korostyshivzeminvest" LLC, which is part of the "Agroprosperis" group, completed spring sowing. This year, the agricultural enterprise, like many other farms in Ukraine, faced an excessive amount of precipitation, which made it impossible for machinery to enter the fields, and delayed the start of sowing.

This was reported in the company.

A total of 5.1 thousand hectares were sown, of which 2.7 thousand hectares were soybeans, 1.7 thousand hectares were sunflowers, 400 hectares were corn and 300 hectares were spring rape.

"We sincerely thank our glorious soldiers of the Armed Forces of Ukraine for the opportunity to work fully, we thank each of the employees of the enterprise who responsibly and thoroughly approached the tasks set, we thank the students of the Golovynsky Higher Vocational School, who passed the training for the first time and helped experienced colleagues! The spring attack on the fields has been completed, we are preparing for the harvest!", said General Director Oleksandr Vozniuk.

We remind you that as of the end of last week in Ukraine [4.7 million hectares of spring grain and leguminous crops were sown](#) .

The rains led to additional costs for the protection of barley

At the "Silgospetkhnikha Nova" farm, barley was sown quite early, so now, due to the rains, it has caught up with a large vegetative mass. Therefore, with this amount of moisture, two fungicidal treatments cannot be dispensed with - diseases are already being infected and will probably continue to develop.

Oleksandr Kirnosov, chief agronomist of the farm, told about this in an interview in the magazine [The Ukrainian Farmer](#).

"Under such circumstances, it makes no sense to make defense cheaper, because we will not be able to work efficiently. We don't want to take a risk and use a cheaper product, because we are not sure that it will control those diseases," said the expert.

In addition, after working with barley, the sowing of sunflower, corn, soybean continues, so there is no time for protection. Because sprayers and mechanizers work on the sowing field.

"I realized that there were so few people - some of them were mobilized to the front. We need to be sure that the fungicide controls diseases so that we don't have to process it later," Oleksandr Kirnosov added.

Aviator Xpro fungicide is used on the farm for barley - it is expensive, but, as the agronomist says, it is worth it. Apply 0.6 l/ha.

Earlier it was reported how the farm "Silgospetkhnikha Nova" [optimized](#) the crop protection system.
