S.E. PARC AGRO INDUSTRIEL DE BUKANGA -LONZO

This first-of-its-kind to Africa, DRC Government initiative commenced in 2013 and launched early 2014 when a special agreement was reached with AFRICOM COMMODITIES RDC to start the development of agricultural sectors throughout the country. "Societe d'exploitation du Parc Agro de Industriel" is essentially a concept of agricultural land development with the implementation of the necessary infrastructure to support a self-sustained economic unit.

This first-of-its-kind to Africa, DRC Government initiative commenced in 2013 and launched early 2014 when a special agreement was reached with AFRICOM COMMODITIES RDC to start the development of agricultural sectors throughout the country. "Societe d'exploitation du Parc Agro de Industriel" is essentially a concept of agricultural land development with the implementation of the necessary infrastructure to support a self-sustained economic unit. This large scale implementation includes not only the best in plantations and arable land development, but also supports structures such as roads, water supply, power lines, housing, hospitals, churches, schools and even landing strips for aircrafts. The first sector development under the new "S.E. Parc Agro de Industriel" initiative has commenced in the district of Bukanga-Lonzo, some 260 km South-East of Kinshasa.

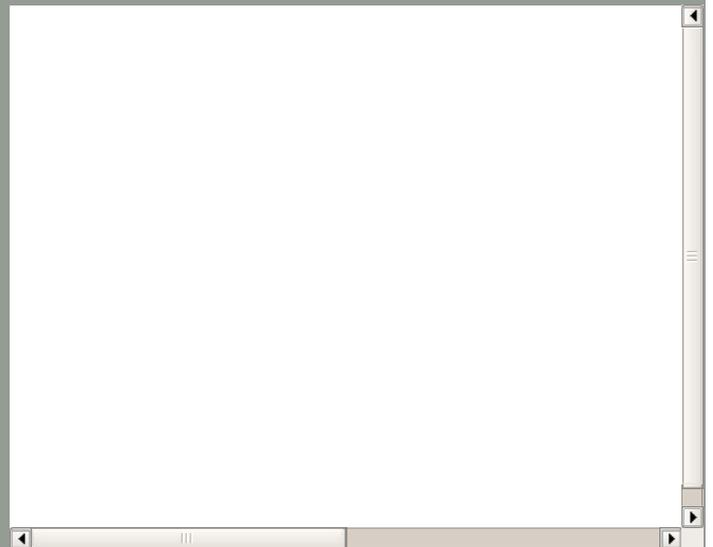

This 80 000ha farm and village development offers a new challenge, the first in Africa, but one which the group of companies under the umbrella of AFRICOM COMMODITIES is well able to establish using this prime land to maximum advantage for all concerned. Other sectors will follow the pilot project of Bukanga-Lonzo.

Allocated land will be developed not only for effective food farming, but also livestock farming and several villages together with the electrical supply in order to maintain this new development from the raw earth comprising schools, clinics, churches and all that is needed for modern day living.

Soil scientists, agronomists and agriculturists analyse the land and all scientific data is collated in order to implement the planting of the most suitable crops based on this cutting edge data. Research and the implementation of the results acquired from this careful survey ensure that the land will be sustained for future generations, and it will also produce the highest possible crop yield at lower costs.

Electrical contractors have established an intricate and effective system to allow for irrigation on the uneven terrain and to supply the villages with electricity. This enables the irrigation system to pump water to the fields where it will be required for superb crop yields and also for household use.

An interactive and dynamic website feeds the public and interested parties with daily news and events at the S.E. Parc Agro farm according to a carefully formulated production timeline.
