## Namoya Information

### Equipment and Infrastructure

2015-08-20

Construction of the Namoya oxide project was commenced in the fourth quarter of 2012. The major installations included the primary crusher, the conveyor belt, the primary product stockpile, and the crushed product stockpile. Diesel generators will be used to produce the power required for the mining operations. A 420km road to Namoya from Uvira was rehabilitated to serve as the main access road. Approximately 220km of the N5 roadway was also reconstructed to provide access to the mine site. Spur road of 200km linking Fzxi and Namoya was additionally constructed under the project.

### Processing

2015-08-20

Mining at Namoya commenced with the pit development of Seketi and Mwendamboko deposits. Oxides and transitional ores are stockpiled and graded based on the ore quality. The ore processing will be done using hybrid carbon-in-leach (CIL)/gravity and heap leach methods for easily leachable oxide and transitional ores, while a milling/carbon-in-leach (CIL) plant will be installed in the second phase to treat fresh rock.

### Mineralisation

2015-08-20

The mineralization at Namoya is structurally controlled by a 2.5 km, NW-SE trending shear zone within sericite schists, which hosts a series of quartz 'stockwork' deposits. The auriferous vein systems outcrop at the summits of Mt. Mwendamboko, Mt. Namoya, Mt. Kakula, and Mt. Muviringu. Mineralized 'stockwork' outcrops have also been located on eight other hills in the general area.

### General

2015-08-20

Banro's Namoya (oxide) project began construction in the fourth quarter of 2012 and completed construction and began commissioning during Q2 of 2014. At full capacity, the Namoya mine is expected to produce roughly 9,000 to 10,000 ounces per month. The Namoya property lies at the southern end of the Twangiza-Namoya gold belt in Maniema province, approximately 225 kilometers southwest of Bukavu and consists of one PE covering an area of 174 square kilometres.

## Mining History

2015-08-20

Alluvial deposits of gold were first discovered at Namoya in 1930 and mined between 1931 and 1947. Primary gold was also discovered during this period and underground mining commenced on the Filon 'B' deposit in 1947. Further discoveries of primary gold mineralization were made at Mwendamboko, Kakula and Muviringu, where selective mining was carried out. The majority of this mining was based on small-scale underground development along specific mineralized quartz veins or stockwork zones. During the 1950s a small open pit was established on Mt. Mwendamboko. Mining ceased in 1961, although there remained substantial un-mined resources in the various deposits plus several other untested mineralized targets. Limited regional and strike exploration appears to have been conducted since 1961. Total historical production at Namoya has been estimated at 278,000 ounces of gold. The Namoya project was 96% complete as of early January 2014.

### [Ortac increases investment in DRC-focused miner](#)

2016-08-12

Aim-listed exploration and mine development company Ortac Resources has increased its investment in Casa Mining, the owner of the Akyanga gold resource, in the Democratic Republic of Congo (DRC), to 13%. Ortac subscribed for 166 667 shares at a price of \$0.30 apiece, for a total consideration of \$50 000. In addition, for a period of two months, Ortac has the right to subscribe for a further 233 333 shares in Casa at \$0.30 a share and to subscribe for any unallocated placing shares from Casa's current placing. Meanwhile, a recent review of the Akyanga resource returned a potential resource increase to over 2.3-million ounces, at a 0.5 g/t cut-off grade – up from 1.2-million ounces from the maiden estimation.
